

BASEDCODEX

How to use the app

Part A: how people use the app.

Part B: how BasedCodex makes money (ads + generation fees).

Two user paths: Guest = browse Explore + Base · Developer = build a MyPage into Explore

Money model: Featured placement fees (algorithm helps reach) + small fee on every page generation & update

Local product demo · Base-quality pages · Not financial advice

What you're using (in one minute)

BasedCodex is a map of crypto products as full pages — plus a builder that ships those pages into the map.

Home

Story of the problem (crypto noise) and who the app is for. Orient only — you don't build here.

About crypto

Short education: rails, self-custody, currency. Use when someone asks “why does this matter?”

Explore

The product map. Featured products live here. Click a card → full product page opens.

Base page

Flagship showcase. Density bar for quality. Guests read it; developers copy its bar.

MyPage

Developer only. Write a product brief, pick a format, Build page (local). Page lands in Explore.

Pins

Saved favourites. Pin Base (or your own page) so you can reopen without hunting the grid.

Who uses it — and how far they go

GUEST / VISITOR

Browse only — no builder

- 1
· Open the app (local launcher or server).
- 2
· Skim Home so you know the problem.
- 3
· Optional: About crypto for rails / custody / currency.
- 4
· Tap Explore → open Featured card (Base).
- 5
· Scroll the full Base product page.
- 6
· Pin it if you want it saved. Stop here.

DEVELOPER / BUILDER

Browse, then ship a page

- 1
· Do the guest path first (feel Base density).
- 2
· Stay signed in as Developer (default local session).
- 3
· Open MyPage from the top bar.
- 4
· Build page tab: topic + format + brand + brief.
- 5
· Optional: Ask AI · expand brief (brief only).
- 6
· Tap Build page (local) → review → Update if needed.

End-to-end path (demo order)

Walk this order in a live demo. Each step has one job — don't skip Base before MyPage.

THE MESS

WHO IT'S FOR

HOW TO BUILD

What is BasedCodex?

A map for crypto products — and a builder for Base-quality pages you publish into Explore.

WITHOUT THIS

Crypto noise

- Threads, dumps & coin lists everywhere
- No clear home for real product pages
- Builders lost next to hype & scams
- Favourites? Scattered bookmarks

vs

BASEDCODEX

Map + page builder

- **Explore** — products by category
- **MyPage** — build Base-quality pages
- **Pins** — save what matters
- **About** — why crypto rails exist

BasedCodex is not another coin list — it's where crypto products live, and where you build their pages.

ABOUT
CRYPTO

EXPLORE

PINS

THE MESS

WHO IT'S FOR

HOW TO BUILD

Who it's for

Visitors browse and pin. Builders ship Base-quality product pages from MyPage.

YOU EXPLORE

Visitors & fans

- Browse categories on Explore
- Open real product pages
- Pin favourites for later
- Learn the “why” under About

vs

YOU PUBLISH

Builders & teams

- MyPage · Build with API or Sources → Build
- 12 format templates (flagship, orbit, dock...)
- One product page → one Explore category
- Strong API only — weak / rushed models are blocked

Same map — explore on one side, publish on the other.

THE MESS

WHO IT'S FOR

HOW TO BUILD

How to build a page

MyPage pipeline: strong API → Build with API or Sources →
format template → publish to Explore.

- 1 Open MyPage → API setup**
Paste a real key. Turn *image generation* on. Leave Prefer speed and Weak model off — weak APIs cannot run Build.
- 2 Build with API**
Pick a crypto topic, brand name, and dense brief. Choose a format template (flagship, orbit, dock...). Hit *Build with API* — Base-page density is the bar.
- 3 Or Sources → Build**
Add PDFs, docs URLs, or searches. Prefer *Fetch only* so real page images land on the product. Same format templates as Build with API.
- 4 Preview, update, pin**
Open your live page, soft-edit sections, snapshot versions. Pin it. Explore shows it under its category for everyone browsing the map.
- 5 Quality rules**
No weak / rushed / no-generation APIs. No thin prompts. Format templates meet the Base showcase benchmark — dense KPIs, surfaces, network, FAQs.

Weak APIs are blocked. Base showcase density is the quality bar for every format.

About crypto (optional)

Why you open this

Education layer for audiences that need rails / custody / currency context — not product marketing.

How to use it (clicks)

- 1 Tap About crypto in the bottom dock (or shell nav).
- 2 Switch the three tabs: Rails → Self-custody → Currency.
- 3 Use one tab only if the demo is short; don't read all three aloud.
- 4 Return to Explore when the audience “gets” why product pages matter.

You know it worked when...

Context is covered without mixing education into Explore product cards.

Tip: Skip this entirely for crypto-native rooms — go Home → Explore.

Explore — open the product map

Why you open this

This is the map. Products live here as cards. Featured is the front door.

How to use it (clicks)

- 1 Tap Explore in the bottom dock.
- 2 Look at Featured first — Base is the flagship showcase card.
- 3 Click the Base card (not just hover) to open the full page.
- 4 Later: use categories when more products exist; Pins for favourites.

You know it worked when...

A full product page opens — not a thin link-out or thumbnail only.

Tip: Inventory is Base-first on purpose: one dense example before user builds.

Read the Base flagship page

Why you open this

Base is the quality bar. Guests experience a finished product; developers steal the density target.

How to use it (clicks)

- 1 From Explore, open Base (Featured card).
- 2 Scroll the whole page: hero → metrics → charts → pillars → surfaces → FAQ.
- 3 Optional: play page audio if the soundtrack control appears.
- 4 Tap Pin to save; use Back to return to Explore.

You know it worked when...

You felt Base-benchmark density — charts, structure, media, not a brochure stub.

Tip: Developers: open MyPage only after this scroll — build to this bar.

Step 5 — MyPage (developer workshop)

MyPage is the only place new product pages are created. Open it from the top bar while signed in as Developer.

1 API setup

Optional remote key for Ask AI features.
Not required for Build page (local).

2 Build page

Main path. Topic + format + brand + brief
→ Build page (local) → publishes
MyPage.

3 Update

Edit named sections on the live page
(hero, FAQ, charts...) without full rebuild.

4 Sources

PDFs / URLs / search → research plan →
same format templates with real content.

5 Upload

Import a script/JSON pack if you already
have a product definition.

6 Library

Versions & drafts on this device —
restore, export, or re-publish from history.

Build a page (local) — main path

Why you open this

This is how a product page gets onto Explore. Generation runs in the app — no remote build API required.

How to use it (clicks)

- 1 Top bar → MyPage. Open the Build tab (Build with API / Build page).
- 2 Pick a crypto topic and a page format (flagship, orbit, dock, ...).
- 3 Set category, at least 2 subtopics, brand name, and a full product brief (≥140 chars, who + what).
- 4 Optional: Ask AI · expand brief — rewrites the brief only, does not build.
- 5 Tap Build page (local). Wait for generate + publish, then review the open page.

You know it worked when...

Your MyPage is live and visible from Explore — you can open it like Base.

Tip: Revenue: each successful generation charges a small generation fee (see money section).

Update a live MyPage

Why you open this

After the first build you iterate. Named-section updates keep structure and density.

How to use it (clicks)

- 1 MyPage → Update tab (must already have a live MyPage).
- 2 Write instructions that name sections, e.g. “hero and faqs: clearer CTA”.
- 3 Choose soft edit or force section replace.
- 4 Run the update. Only named parts change; the rest of the page stays.

You know it worked when...

You refined the page without wiping layout or starting from zero.

Tip: Revenue: every update run also charges a small fee — same meter as generation.

Build from PDFs / URLs (optional)

Why you open this

When the product story lives in docs or links, Sources feeds research into the same formats.

How to use it (clicks)

- 1 MyPage → Sources tab.
- 2 Add at least one PDF, URL, or search query.
- 3 Tap Ask AI to research & plan (uses configured API when present).
- 4 Review the plan, then generate into a format template and publish.

You know it worked when...

A page grounded in real source material, still on the Explore map.

Tip: If sources are thin or off-topic, fall back to the brief-based Build tab.

How BasedCodex makes money

Two engines. Featured advertising sells discovery on Explore. Generation fees sell the builder every time someone ships or revises a page.

ENGINE 1

Featured advertising

Monetize the Featured slot on Explore. Projects pay an advertising fee to put their product page in Featured — the front door of the map.

Who pays: projects that want more eyes on their page.
What they buy: Featured placement + algorithm-assisted reach to grow audience.

ENGINE 2

Generation fees

Every time the builder runs, BasedCodex charges a small fee — first page generation and every later update.

Who pays: developers / teams using MyPage.

What triggers a fee:

- Build page (local) / full generation
- Update (named sections or force replace)
- Sources / regenerate paths that mint a new page version

Monetize Featured — grow audience

Simple story: pay to be Featured on Explore. Algorithms help that page find the right visitors and grow its audience.

1 · Pay for Featured

Advertising fee unlocks the Featured spot on Explore — the first place guests look. Your product page sits at the front of the map.

2 · Algorithm helps reach

Once Featured (or promoted), ranking / recommendation algorithms surface the page to people likely to care — not just a static pin.

3 · Audience grows

More opens, pins, and return visits. Featured is distribution: fee → placement → algorithm → more eyes on the product page.

4 · Say this in a pitch

“You pay to Feature your page. Our algorithms help you gain audience from Explore traffic — Featured is how products get discovered.”

Generation fee on every build & update

The builder is metered. A small fee is fetched whenever the app generates or rewrites a product page — not only on the first create.

Action	Fee	What it means
Build page (local)	Small generation fee	First full MyPage (or full regenerate). Topic + format + brief → publish.
Update (any run)	Small generation fee	Soft edit or force section replace — still a billed generation event.
Sources / research build	Small generation fee	When the pipeline plans and mints a page from PDFs/URLs, same meter applies.
Browse only (Explore, Base, Home)	No generation fee	Guests reading the map do not pay to browse. Ad revenue covers attention.

How to explain the money model

1

Featured pays for discovery

Projects pay an advertising fee to put their page in Featured on Explore. Algorithms then help that page gain audience from map traffic.

2

Creation pays with generation fees

Teams that Build a product page pay a small fee each time the generator runs — first ship included.

3

Iteration still pays

Updates are not free edits. Every update (soft or force) fetches the small generation fee again, so ongoing product polish still earns.

4

Guests stay free to browse

Reading Home, About, Explore, and Base is free. Featured fees + generation fees fund the platform without charging casual visitors.

Recap — use + money

1 · Orient & browse

Home → optional About → Explore → open Base. Guests can stop here (no generation fee).

2 · Build (developers)

MyPage → topic + format + brand + brief → Build page (local). Small generation fee on each build.

3 · Iterate

Update named sections · Sources as needed. Every update also charges a small generation fee.

4 · Platform revenue

Featured advertising fees (algorithm helps audience growth) + small generation/update fees from builders.

SAY THIS OUT LOUD

Usage

Home → About (optional) → Explore → Base → MyPage → brief + format → Build page (local) → Update if needed → Explore again.

Money

Projects pay to Feature their page on Explore — algorithms help them gain audience. Separately, every page generation and every update fetches a small generation fee. Browse stays free.

Guests browse free · Featured fees = discovery · Generation fees = build + update · Not financial advice
